ABSTRACTED-PUB-NO: WO 9922294A

BASIC-ABSTRACT:

NOVELTY - The method involves using helper codes which are sent in input signals and operating a supervisory computer system to actuate a switch to connect the input and output devices.

DETAILED DESCRIPTION - The method of interfacing several server computers with output and input devices at several user locations involves

(a) (a) receiving input signals sent by input devices included in sets of input and output devices at user locations, conveying input signals from the input devices to server computers associated with the user locations and conveying output signals from such server computers to output devices at the user locations;

(b) (b) detecting one or more predetermined helper codes in input signals and passing the helper codes to a supervisory computer system;

(c) (c) operating the supervisory computer system so that the supervisory computer system actuates a switch in response to the helper codes to connect the set of input and output devices which sent the helper code to a helper computer;

(d) (d) running an interactive program for selecting one or more of the server computers in the helper computer so that the helper computer interacts with a user at the user location which sent a helper code; and

(e) (e) actuating the switch to connect or disconnect one or more server computers selected during operation of the interactive program and input and output devices at one or more user locations.

USE - For computer networks with several PCs.

ADVANTAGE - Allows system to operate without extra communications lines to the user locations for the interchange of the command codes.

DESCRIPTION OF DRAWING(S) - The drawing shows a diagrammatic view depicting the apparatus used in the method.
